**9. Reduction to Practice**

Has a prototype of the invention been constructed?

NO

☐

YES

☒

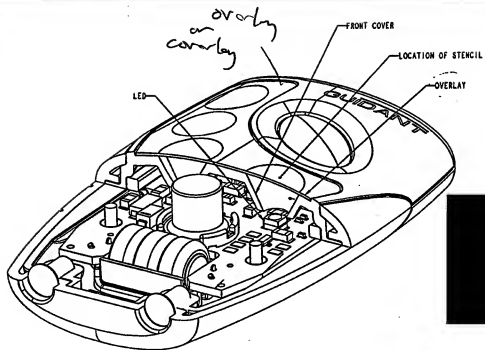

If YES, indicate date of completion:

**11. Description of Invention**

Scope (proven and potential):

User Feedback mechanism utilizing a simple display. The mechanism communicates implantable medical device condition, which may include the device condition or physiological condition. The mechanism is a stencil that is illuminated from behind when the condition is present and absent when the condition is not present. Thus, the illuminated stencil produces an indication. The absence of the condition does not produce an indication and thus the display appears "dark" or blank. Thus the term "dead-front". This shall be referred to as "dead-front" cardiac condition indicator.
